

Framework Selection Report

Pangasinan Heritage Digital Showcase • Activity 1.1

1. Project Context

The brief requires a resilient, accessible, maintainable and high-performing showcase optimized for 3G/4G mobile data, mobile-first layouts, modular architecture, WCAG 2.1 AA principles, and static/JAMstack-style deployment.

2. Quantitative Decision Matrix

Scale: 1 = weak, 5 = excellent. Weighted total = score × criterion weight.

Criterion	Weight	Next.js 14	Nuxt.js 3
Bundle/performance	25%	5	4
Developer velocity	15%	5	5
Ecosystem maturity	15%	5	4
Learning curve	10%	3	4
Component architecture	10%	5	5
Documentation/community	10%	5	5
Project suitability	15%	5	4
TOTAL	100%	4.75	4.35

3. Recommendation

Select React with Next.js 14 App Router. It provides a strong component model, mature ecosystem, route-level architecture, and a static export path. This matches a content-first, low-data showcase.

4. Criteria Discussion

Next.js supports static export and route-based output, while React components provide a direct mapping to the required Atomic Design system. Nuxt also provides strong component architecture and static generation, but the requested assignment explicitly names Next.js 14 as Option A and Nuxt.js 3 as Option B.

5. Current Lifecycle Note

Current Nuxt documentation reports that Nuxt 3 reached end of life on July 31, 2026. This is a current lifecycle consideration. The comparison nevertheless retains Nuxt.js 3 because that is the exact alternative specified by the assignment.

6. Final Decision

Next.js 14 (App Router) is recommended because it best balances performance, maintainability, reusable component architecture, accessibility implementation, and static deployment suitability for this deliverable.
